5.232 lex_lesseq

| | DESCRIPTION | LINKS | GRAPH | AUTOMATON |
|-----------------|---|--|--|-------------|
| Origin | CHIP | | | |
| Constraint | <pre>lesseq(VECTOR1, VECTOR2)</pre> | | | |
| Synonyms | lexeq, lex_chain, rel, lesseq, leq, lex_leq. | | | |
| Arguments | VECTOR1 : collection VECTOR2 : collection | · / | | |
| Restrictions | <pre>required(VECTOR1, var) required(VECTOR2, var) VECTOR1 = VECTOR2 </pre> | | | |
| Purpose | VECTOR1 is lexicographically \vec{Y} of <i>n</i> components, $\langle X_0, \ldots$ than or equal to \vec{Y} if and only is lexicographically less than | $\langle X_{n-1} \rangle$ and $\langle Y_0, \dots, Y_n \rangle$ of $n = 0$ or $X_0 < Y_0$ | $\langle X_{n-1} \rangle, \vec{X}$ is <i>lexicographi</i> or $X_0 = Y_0$ and $\langle X_1,$ | ically less |
| Example | $(\langle 5, 2, 3, 1 \rangle, \langle 5, 2, 6, 2 \rangle) \\ (\langle 5, 2, 3, 9 \rangle, \langle 5, 2, 3, 9 \rangle)$ The lex_lesseq constraints since: | associated with the | first and second exam | ples hold |
| | Within the first example equal to VECTOR2 = (5, Within the second example equal to VECTOR2 = (5, | $2, 6, 2\rangle$. ble VECTOR1 = $\langle 5, 2, 3 \rangle$ | | |
| Typical | VECTOR1 > 1 $\bigvee \left(\begin{array}{c} \texttt{VECTOR1} < 5, \\ \texttt{nval}([\texttt{VECTOR1.var}, \texttt{V}]) \\ \bigvee \left(\begin{array}{c} \texttt{maxval}([\texttt{VECTOR1.var}, \texttt{V}]) \\ 2* \texttt{VECTOR1} - \texttt{max.m} \end{array} \right)$ | VECTOR2.var] < 2 * V r, $\texttt{VECTOR2.var}]) \leq 1,$ value([VECTOR1.var, V) | (ECTOR1) /ECTOR2.var]) > 2) | |
| Symmetries | VECTOR1.var can be deVECTOR2.var can be in | | | |
| Arg. properties | Suffix-contractible wrt. VECTO | R1 and VECTOR2 (remo | ve items from same positi | ion). |
| Remark | A <i>multiset ordering</i> constrain in [174]. | t and its corresponding | g filtering algorithm are | described |

Algorithm

The first filtering algorithm maintaining arc-consistency for this constraint was presented in [173]. A second filtering algorithm maintaining arc-consistency and detecting entailment in a more eager way, was given in [96]. This second algorithm was derived from a deterministic finite automata. A third filtering algorithm extending the algorithm presented in [173] detecting entailment is given in the PhD thesis of Z. Kızıltan [239, page 95]. The previous thesis [239, pages 105-109] presents also a filtering algorithm handling the fact that a given variable has more than one occurrence. Finally, T. Frühwirth shows how to encode lexicographic ordering constraints within the context of CHR [175] in [176].

Reformulation

The following reformulations in term of arithmetic and/or logical expressions exist for enforcing the *lexicographically less than or equal to* constraint. The first one converts \vec{X} and \vec{Y} into numbers and post an inequality constraint. It assumes all components of \vec{X} and \vec{Y} to be within [0, a - 1]:

$$a^{n-1}X_0 + a^{n-2}X_1 + \dots + a^0X_{n-1} \le a^{n-1}Y_0 + a^{n-2}Y_1 + \dots + a^0Y_{n-1}$$

Since the previous reformulation can only be used with small values of n and a, W. Harvey came up with the following alternative model that maintains arc-consistency:

 $(X_0 < Y_0 + (X_1 < Y_1 + (\dots + (X_{n-1} < Y_{n-1} + 1)\dots))) = 1$

Finally, the lexicographically less than or equal to constraint can be expressed as a conjunction or a disjunction of constraints:

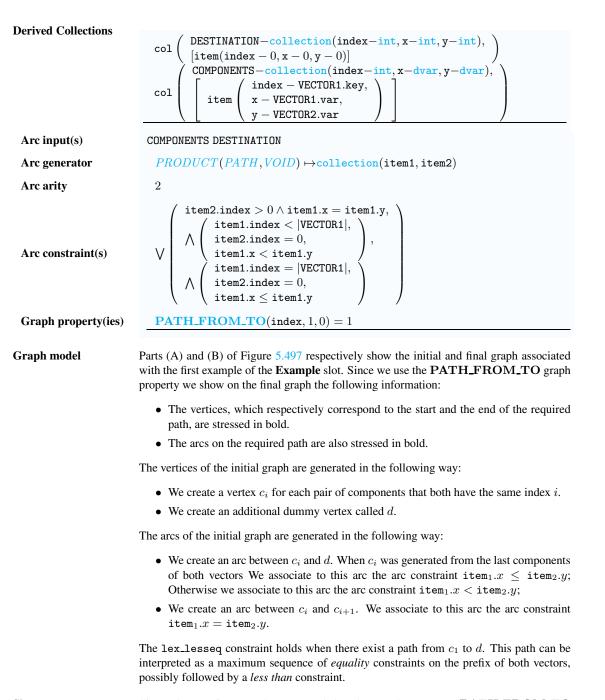

| | $X_0 \le Y_0 \land $ | | | | |
|----------|---|--|--|--|--|
| | $(X_0 = Y_0) \Rightarrow X_1 \le Y_1 \land \\ (X_0 = Y_0 \land X_1 = Y_1) \Rightarrow X_2 \le Y_2 \land$ | | | | |
| | | | | | |
| | $(X_0 = Y_0 \land X_1 = Y_1 \land \dots \land X_{n-2} = Y_{n-2}) \Rightarrow X_{n-1} \le Y_{n-1}$ | | | | |
| | $\begin{array}{ccc} X_0 < Y_0 & \lor \\ X_0 = Y_0 \land X_1 < Y_1 & \lor \\ X_0 = Y_0 \land X_1 = Y_1 \land X_2 < Y_2 & \lor \end{array}$ | | | | |
| | : | | | | |
| | $X_0 = Y_0 \land X_1 = Y_1 \land \dots \land X_{n-2} = Y_{n-2} \land X_{n-1} \le Y_{n-1}$ | | | | |
| | When used separately, the two previous logical decompositions do not maintain arc-consistency. | | | | |
| Systems | lexEq in Choco, rel in Gecode, lex_lesseq in MiniZinc, lex_chain in SICStus. | | | | |
| Used in | <pre>lex_between, lex_chain_greatereq, lex_chain_lesseq, ordered_atleast_nvector, ordered_atmost_nvector, ordered_nvector.</pre> | | | | |
| See also | common keyword: allperm, cond_lex_lesseq(lexicographic order), | | | | |
| | <pre>lex2(matrix symmetry,lexicographic order), lex_chain_greater,</pre> | | | | |
| | <pre>lex_chain_greatereq, lex_chain_less(lexicographic order), lex_different(vector), strict_lex2(matrix symmetry,lexicographic order).</pre> | | | | |
| | | | | | |
| | implied by: lex_equal, lex_less, lex_lesseq_allperm. | | | | |
| | <pre>implies (if swap arguments): lex_greatereq.</pre> | | | | |
| | negation: lex_greater. | | | | |
| | system of constraints: lex_between, lex_chain_lesseq. | | | | |

Keywords characteristic of a constraint: vector, automaton, automaton without counters, reified automaton constraint, derived collection. constraint network structure: Berge-acyclic constraint network. constraint type: order constraint. filtering: duplicated variables, arc-consistency. heuristics: heuristics and lexicographical ordering.

symmetry: symmetry, matrix symmetry, lexicographic order, multiset ordering.

Signature Since the maximum value returned by the graph property PATH_FROM_TO is equal to 1 we can rewrite PATH_FROM_TO(index, 1, 0) = 1 to PATH_FROM_TO(index, 1, 0) \geq 1. Therefore we simplify <u>PATH_FROM_TO</u> to <u>PATH_FROM_TO</u>.

Automaton

Figure 5.498 depicts the automaton associated with the lex_lesseq constraint. Let VAR1_i and VAR2_i respectively be the var attributes of the i^{th} items of the VECTOR1 and the VECTOR2 collections. To each pair (VAR1_i, VAR2_i) corresponds a signature variable S_i as well as the following signature constraint: (VAR1_i < VAR2_i \Leftrightarrow $S_i = 1$) \land (VAR1_i = VAR2_i \Leftrightarrow $S_i = 2$) \land (VAR1_i > VAR2_i \Leftrightarrow $S_i = 3$).
