

**5.249 maximum**

	DESCRIPTION	LINKS	GRAPH	AUTOMATON
<b>Origin</b>	CHIP			
<b>Constraint</b>	<code>maximum(MAX, VARIABLES)</code>			
<b>Synonym</b>	<code>max.</code>			
<b>Arguments</b>	<p>MAX : <code>dvar</code></p> <p>VARIABLES : <code>collection(var-dvar)</code></p>			
<b>Restrictions</b>	<p><math> VARIABLES  &gt; 0</math></p> <p><code>required(VARIABLES, var)</code></p>			
<b>Purpose</b>	MAX is the maximum value of the collection of domain variables VARIABLES.			
<b>Example</b>	<p><code>(7, &lt;3, 2, 7, 2, 6&gt;)</code></p> <p><code>(1, &lt;0, 0, 1, 0, 1&gt;)</code></p> <p>The first maximum constraint holds since its first argument <math>MAX = 7</math> is fixed to the maximum value of the collection <math>\langle 3, 2, 7, 2, 6 \rangle</math>.</p>			
<b>Typical</b>	<p><math> VARIABLES  &gt; 1</math></p> <p><code>range(VARIABLES.var) &gt; 1</code></p>			
<b>Symmetries</b>	<ul style="list-style-type: none"> <li>• Items of VARIABLES are <i>permutable</i>.</li> <li>• All occurrences of two distinct values of VARIABLES.var can be <i>swapped</i>.</li> <li>• One and the same constant can be <i>added</i> to MAX as well as to the var attribute of all items of VARIABLES.</li> </ul>			
<b>Arg. properties</b>	<ul style="list-style-type: none"> <li>• <b>Functional dependency</b>: MAX determined by VARIABLES.</li> <li>• <b>Aggregate</b>: <code>MAX(max), VARIABLES(union)</code>.</li> </ul>			
<b>Usage</b>	In some project scheduling problems one has to introduce dummy activities that correspond for instance to the completion time of a given set of activities. In this context one can use the maximum constraint to get the maximum completion time of a set of tasks.			
<b>Remark</b>	<p>Note that maximum is a constraint and not just a function that computes the maximum value of a collection of variables: potential values of MAX influence the variables of VARIABLES, and reciprocally potential values that can be assigned to variables of VARIABLES influence MAX.</p> <p>The maximum constraint is called max in <b>JaCoP</b> (<a href="http://www.jacop.eu/">http://www.jacop.eu/</a>).</p>			

**Algorithm**

A filtering algorithm for the maximum constraint is described in [27].

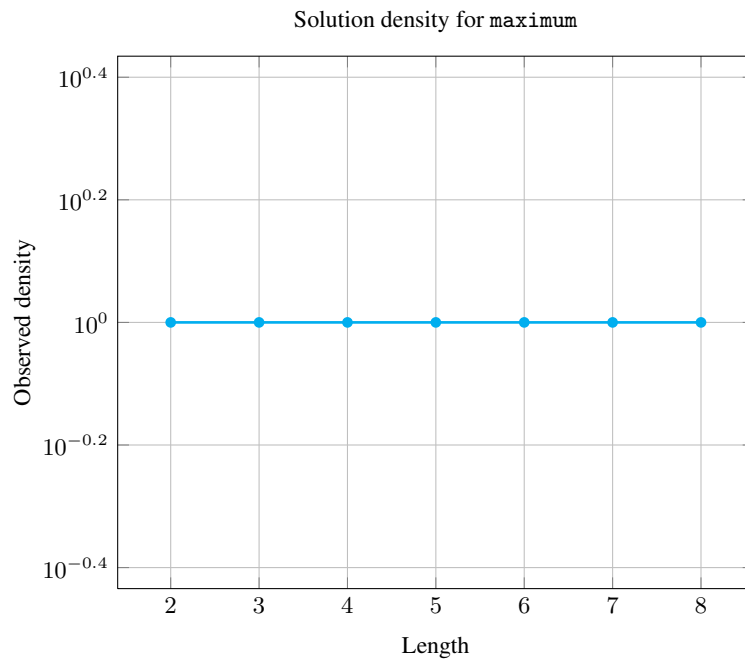

The maximum constraint is **entailed** if all the following conditions hold:

1. MAX is fixed.
2. At least one variable of VARIABLES is assigned value MAX.
3. All variables of VARIABLES have their maximum value less than or equal to value MAX.

**Counting**

Length ( $n$ )	2	3	4	5	6	7	8
Solutions	9	64	625	7776	117649	2097152	43046721

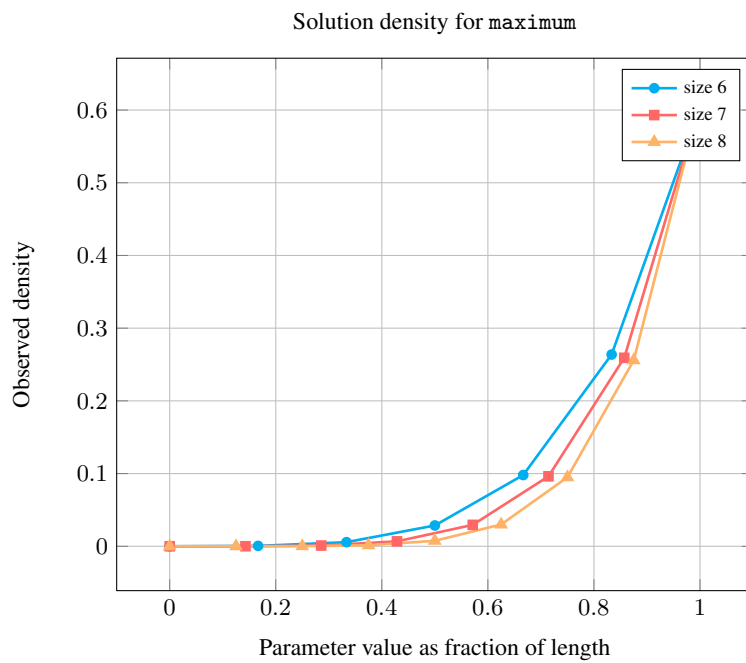

Number of solutions for maximum: domains  $0..n$

<b>Arc input(s)</b>	VARIABLES
<b>Arc generator</b>	$CLIQUE \mapsto collection(variables1, variables2)$
<b>Arc arity</b>	2
<b>Arc constraint(s)</b>	$\bigvee \left( \begin{array}{l} variables1.key = variables2.key, \\ variables1.var > variables2.var \end{array} \right)$
<b>Graph property(ies)</b>	$ORDER(0, MININT, var) = MAX$

**Graph model**

We use a similar definition that the one that was utilised for the `minimum` constraint. Within the arc constraint, we replace the comparison operator `<` by `>`.

Parts (A) and (B) of Figure 5.520 respectively show the initial and final graph associated with the first example of the **Example** slot. Since we use the **ORDER** graph property, the vertex of rank 0 (without considering the loops) of the final graph is outlined with a thick circle.

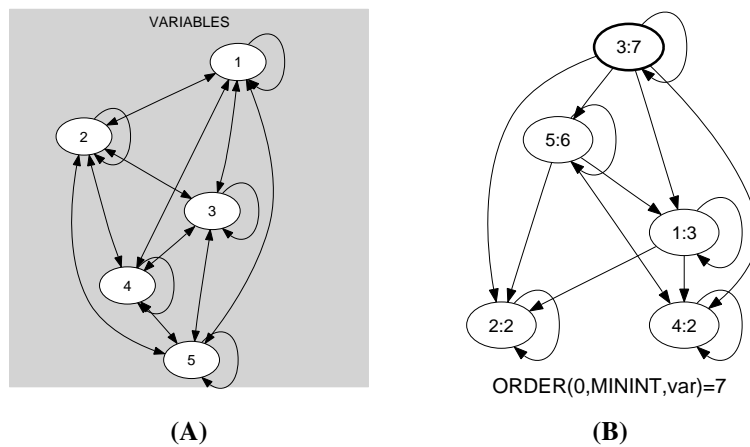

Figure 5.520: Initial and final graph of the maximum constraint

**Automaton**

Figure 5.521 depicts the automaton associated with the maximum constraint. Let  $VAR_i$  be the  $i^{th}$  variable of the VARIABLES collection. To each pair  $(MAX, VAR_i)$  corresponds a signature variable  $S_i$  as well as the following signature constraint:  $(MAX > VAR_i \Leftrightarrow S_i = 0) \wedge (MAX = VAR_i \Leftrightarrow S_i = 1) \wedge (MAX < VAR_i \Leftrightarrow S_i = 2)$ .

Figure 5.521: Counter free automaton of the maximum constraint

Figure 5.522: Hypergraph of the reformulation corresponding to the automaton of the maximum constraint

Figure 5.522 depicts a second counter free non deterministic automaton associated with the maximum constraint, where the argument MAX is also part of the sequence passed to the automaton.

Figure 5.525 depicts a third deterministic automaton with one counter associated with the maximum constraint, where the argument MAX is unified to the final value of the counter.

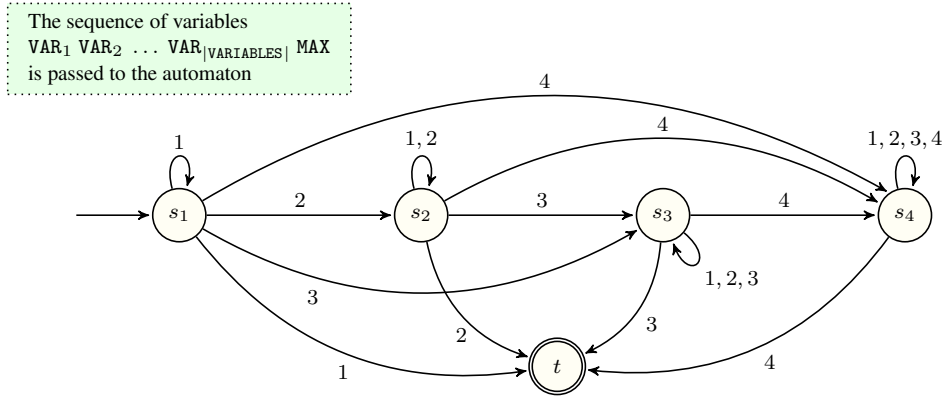

Figure 5.523: Counter free non deterministic automaton of the maximum(MAX, VARIABLES) constraint assuming that the union of the domain of the variables is the set {1, 2, 3, 4} and that the elements of VARIABLES are first passed to the automaton followed by MAX (state  $s_i$  means that no value strictly greater than value  $i$  was found and that value  $i$  was already encountered at least once)

Figure 5.524: Hypergraph of the reformulation corresponding to the counter free non deterministic automaton of the maximum constraint

Figure 5.525: Automaton (with one counter) of the maximum constraint and its glue constraint

Figure 5.526: Hypergraph of the reformulation corresponding to the automaton (with one counter) of the maximum constraint: since all states variables  $Q_0, Q_1, \dots, Q_n$  are fixed to the unique state  $s$  of the automaton, the transitions constraints share only the counter variable  $C$  and the constraint network is Berge-acyclic
