

## 5.270 nand

	DESCRIPTION	LINKS	AUTOMATON																
<b>Origin</b>	Logic																		
<b>Constraint</b>	<code>nand(VAR, VARIABLES)</code>																		
<b>Synonym</b>	<code>clause.</code>																		
<b>Arguments</b>	<code>VAR</code> : <code>dvar</code> <code>VARIABLES</code> : <code>collection(var-dvar)</code>																		
<b>Restrictions</b>	$\text{VAR} \geq 0$ $\text{VAR} \leq 1$ $ \text{VARIABLES}  \geq 2$ <code>required(VARIABLES, var)</code> $\text{VARIABLES.var} \geq 0$ $\text{VARIABLES.var} \leq 1$																		
<b>Purpose</b>	<p>Let <code>VARIABLES</code> be a collection of 0-1 variables <math>\text{VAR}_1, \text{VAR}_2, \dots, \text{VAR}_n</math> (<math>n \geq 2</math>). Enforce <math>\text{VAR} = \neg(\text{VAR}_1 \wedge \text{VAR}_2 \wedge \dots \wedge \text{VAR}_n)</math>.</p>																		
<b>Example</b>	$(1, \langle 0, 0 \rangle)$ $(1, \langle 0, 1 \rangle)$ $(1, \langle 1, 0 \rangle)$ $(0, \langle 1, 1 \rangle)$ $(1, \langle 1, 0, 1 \rangle)$																		
<b>Symmetry</b>	Items of <code>VARIABLES</code> are <code>permutable</code> .																		
<b>Arg. properties</b>	<ul style="list-style-type: none"> <li>• <b>Functional dependency</b>: <code>VAR</code> determined by <code>VARIABLES</code>.</li> <li>• <b>Contractible</b> wrt. <code>VARIABLES</code> when <code>VAR = 0</code>.</li> <li>• <b>Extensible</b> wrt. <code>VARIABLES</code> when <code>VAR = 1</code>.</li> <li>• <b>Aggregate</b>: <code>VAR(∨)</code>, <code>VARIABLES(union)</code>.</li> </ul>																		
<b>Counting</b>	<table border="1"> <tr> <td>Length (<math>n</math>)</td> <td>2</td> <td>3</td> <td>4</td> <td>5</td> <td>6</td> <td>7</td> <td>8</td> </tr> <tr> <td>Solutions</td> <td>4</td> <td>8</td> <td>16</td> <td>32</td> <td>64</td> <td>128</td> <td>256</td> </tr> </table> <p>Number of solutions for <code>nand</code>: domains 0..<math>n</math></p>			Length ( $n$ )	2	3	4	5	6	7	8	Solutions	4	8	16	32	64	128	256
Length ( $n$ )	2	3	4	5	6	7	8												
Solutions	4	8	16	32	64	128	256												

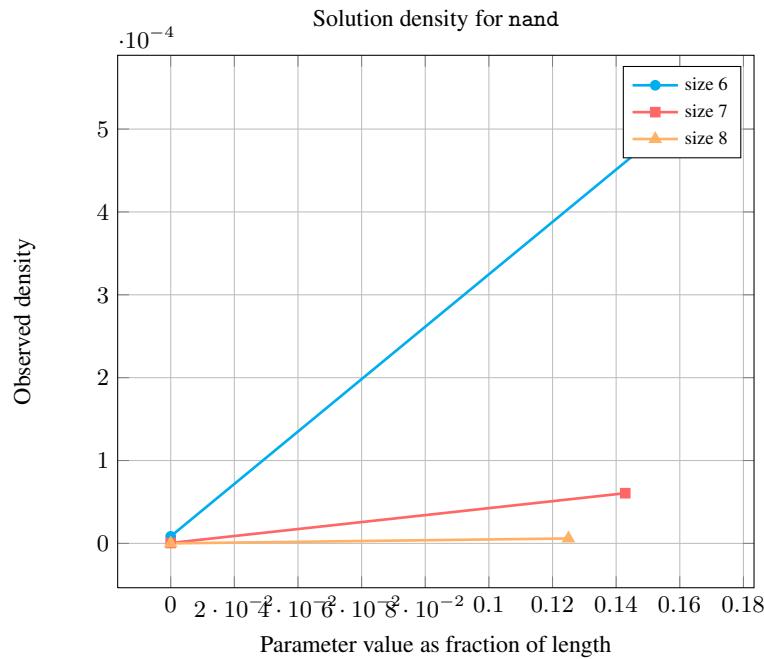

Length ( $n$ )	2	3	4	5	6	7	8
Total	4	8	16	32	64	128	256
Parameter value	0	1	1	1	1	1	1
1	3	7	15	31	63	127	255

Solution count for `nand`: domains 0.. $n$

Solution density for `nand`

**Systems**

clause in Choco, clause in Gecode, #/“in SICStus.

**See also**

**common keyword:** and, equivalent, imply, nor, or, xor (*Boolean constraint*).  
**implies:** atleast\_nvalue.

**Keywords**

**characteristic of a constraint:** automaton, automaton without counters, reified automaton constraint.  
**constraint arguments:** pure functional dependency.  
**constraint network structure:** Berge-acyclic constraint network.  
**constraint type:** Boolean constraint.  
**filtering:** arc-consistency.  
**modelling:** functional dependency.

**Cond. implications**

nand(VAR, VARIABLES)  
 with  $|VARIABLES| > 2$   
 implies some\_equal(VARIABLES).

**Automaton**

Figure 5.571 depicts the automaton associated with the `nand` constraint. To the first argument `VAR` of the `nand` constraint corresponds the first signature variable. To each variable  $\text{VAR}_i$  of the second argument `VARIABLES` of the `nand` constraint corresponds the next signature variable. There is no signature constraint.
