

## 5.294 open\_alldifferent

	DESCRIPTION	LINKS	GRAPH
<b>Origin</b>	[427]		
<b>Constraint</b>	<code>open_alldifferent(S, VARIABLES)</code>		
<b>Synonyms</b>	<code>open_alldiff</code> , <code>open_alldistinct</code> , <code>open_distinct</code> .		
<b>Arguments</b>	<p><code>S</code> : <code>svar</code></p> <p><code>VARIABLES</code> : <code>collection(var-dvar)</code></p>		
<b>Restrictions</b>	<p><math>S \geq 1</math></p> <p><math>S \leq  \text{VARIABLES} </math></p> <p><code>required(VARIABLES, var)</code></p>		
<b>Purpose</b>	<p>Let <math>\mathcal{V}</math> be the variables of the collection <code>VARIABLES</code> for which the corresponding position belongs to the set <code>S</code>. Positions are numbered from 1. Enforce all variables of <math>\mathcal{V}</math> to take distinct values.</p>		
<b>Example</b>	<p><code>({2, 3, 4}, &lt;9, 1, 9, 3&gt;)</code></p> <p>The <code>open_alldifferent</code> constraint holds since the last three (i.e., <math>S = \{2, 3, 4\}</math>) values of the collection <code>&lt;9, 1, 9, 3&gt;</code> are distinct.</p>		
<b>Typical</b>	<code> \text{VARIABLES}  &gt; 2</code>		
<b>Symmetry</b>	All occurrences of two distinct values of <code>VARIABLES.var</code> can be <code>swapped</code> ; all occurrences of a value of <code>VARIABLES.var</code> can be <code>renamed</code> to any unused value.		
<b>Arg. properties</b>	<code>Suffix-contractible</code> wrt. <code>VARIABLES</code> .		
<b>Usage</b>	<p>In their article [427], W.-J. van Hoes and J.-C. Régin motivate the <code>open_alldifferent</code> constraint by the following scheduling problem. Consider a set of activities (where each activity has a fixed duration 1 and a start variable) that can be processed on two factory lines such that all the activities that will be processed on a given line must be pairwise distinct. This can be modelled by using one <code>open_alldifferent</code> constraint for each line, involving all the start variables as well as a set variable whose final value specifies the set of activities assigned to that specific factory line.</p> <p>Note that this can also be directly modelled by a single <code>diffn</code> constraint. This is done by introducing an assignment variable for each activity. The initial domain of each assignment variable consists of two values that respectively correspond to the two factory lines.</p>		
<b>Algorithm</b>	A slight adaptation of the <code>flow</code> model that handles the original <code>global_cardinality</code> constraint [342] is described in [427]. The rightmost part of Figure 3.29 illustrates this flow model.

**common keyword:** [size\\_max\\_seq\\_alldifferent](#), [size\\_max\\_starting\\_seq\\_alldifferent](#) (*all different, disequality*).

**generalisation:** [open\\_global\\_cardinality](#) (*control the number of occurrence of each active value<sup>13</sup> with a counter variable*), [open\\_global\\_cardinality\\_low\\_up](#) (*control the number of occurrence of each active value with an interval*).

**hard version:** [alldifferent](#).

**used in graph description:** [in\\_set](#).

**Keywords**

**characteristic of a constraint:** all different, disequality.

**constraint arguments:** constraint involving set variables.

**constraint type:** open constraint, soft constraint, value constraint.

**filtering:** flow.

---

<sup>13</sup>An *active value* corresponds to a value occurring at a position mentioned in the set S.

<b>Arc input(s)</b>	VARIABLES
<b>Arc generator</b>	<code>CLIQUE</code> $\mapsto$ <code>collection</code> (variables1, variables2)
<b>Arc arity</b>	2
<b>Arc constraint(s)</b>	<ul style="list-style-type: none"> <li>• variables1.var = variables2.var</li> <li>• <code>in_set</code>(variables1.key, S)</li> <li>• <code>in_set</code>(variables2.key, S)</li> </ul>
<b>Graph property(ies)</b>	<code>MAX_NSCC</code> $\leq$ 1
<b>Graph class</b>	<code>ONE_SUCC</code>

**Graph model**

We generate a *clique* with an *equality* constraint between each pair of vertices (including a vertex and itself) and state that the size of the largest strongly connected component should not exceed one. Variables for which the corresponding position does not belong to the set S are removed from the final graph by the second and third conditions of the arc-constraint.

Parts (A) and (B) of Figure 5.611 respectively show the initial and final graph associated with the **Example** slot. Since we use the `MAX_NSCC` graph property we show one of the largest strongly connected components of the final graph. The `open_alldifferent` holds since all the strongly connected components have at most one vertex: a value is used at most once.

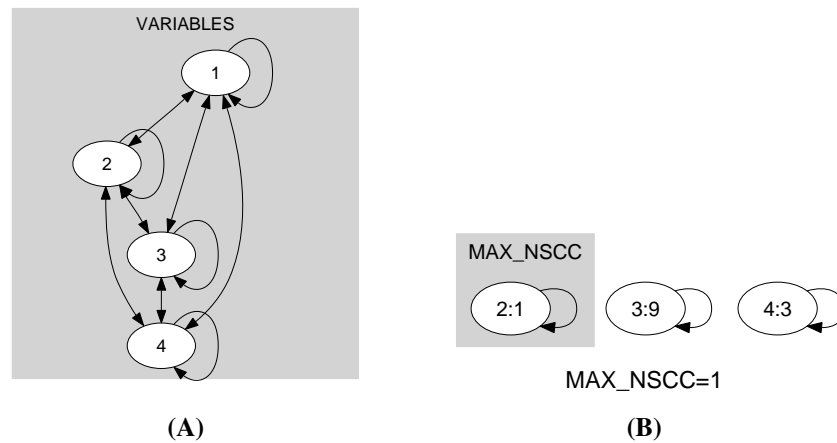

Figure 5.611: Initial and final graph of the `open_alldifferent` constraint
