

## 5.296 open\_atleast

	DESCRIPTION	LINKS	GRAPH
<b>Origin</b>	Derived from <a href="#">atleast</a> and <a href="#">open_global_cardinality</a> .		
<b>Constraint</b>	<code>open_atleast(S, N, VARIABLES, VALUE)</code>		
<b>Arguments</b>	<p>S : <a href="#">svar</a></p> <p>N : <a href="#">int</a></p> <p>VARIABLES : <a href="#">collection</a>(<a href="#">var-dvar</a>)</p> <p>VALUE : <a href="#">int</a></p>		
<b>Restrictions</b>	<p><math>S \geq 1</math></p> <p><math>S \leq  \text{VARIABLES} </math></p> <p><math>N \geq 0</math></p> <p><math>N \leq  \text{VARIABLES} </math></p> <p><a href="#">required</a>(VARIABLES, var)</p>		
<b>Purpose</b>	<p>Let <math>\mathcal{V}</math> be the variables of the collection VARIABLES for which the corresponding position belongs to the set S. Positions are numbered from 1. At least N variables of <math>\mathcal{V}</math> are assigned value VALUE.</p>		
<b>Example</b>	<p><code>({2, 3, 4}, 2, &lt;4, 2, 4, 4&gt;, 4)</code></p> <p>The <code>open_atleast</code> constraint holds since, within the last three (i.e., <math>S = \{2, 3, 4\}</math>) values of the collection <code>&lt;4, 2, 4, 4&gt;</code>, at least <math>N = 2</math> values are equal to value <code>VALUE = 4</code>.</p>		
<b>Typical</b>	<p><math>N &gt; 0</math></p> <p><math>N &lt;  \text{VARIABLES} </math></p> <p><math> \text{VARIABLES}  &gt; 1</math></p>		
<b>Symmetries</b>	<ul style="list-style-type: none"> <li>• N can be <a href="#">decreased</a> to any value <math>\geq 0</math>.</li> <li>• An occurrence of a value of VARIABLES.var that is different from VALUE can be <a href="#">replaced</a> by any other value.</li> </ul>		
<b>Arg. properties</b>	<a href="#">Suffix-extensible</a> wrt. VARIABLES.		
<b>See also</b>	<p><b>common keyword:</b> <a href="#">open_among</a>, <a href="#">open_global_cardinality</a> (<i>open constraint</i>, <i>value constraint</i>).</p> <p><b>comparison swapped:</b> <a href="#">open_atmost</a>.</p> <p><b>hard version:</b> <a href="#">atleast</a>.</p> <p><b>used in graph description:</b> <a href="#">in_set</a>.</p>		
<b>Keywords</b>	<p><b>constraint arguments:</b> constraint involving set variables.</p> <p><b>constraint type:</b> <a href="#">open constraint</a>, <a href="#">value constraint</a>.</p> <p><b>modelling:</b> <a href="#">at least</a>.</p>		

<b>Arc input(s)</b>	VARIABLES
<b>Arc generator</b>	$SELF \mapsto \text{collection}(\text{variables})$
<b>Arc arity</b>	1
<b>Arc constraint(s)</b>	<ul style="list-style-type: none"> <li>• <code>variables.var = VALUE</code></li> <li>• <code>in_set(variables.key, S)</code></li> </ul>
<b>Graph property(ies)</b>	$NARC \geq N$

**Graph model**

Since each arc constraint involves only one vertex (`VALUE` is fixed), we employ the *SELF* arc generator in order to produce a graph with a single loop on each vertex. Variables for which the corresponding position does not belong to the set *S* are removed from the final graph by the second condition of the arc-constraint.

Parts (A) and (B) of Figure 5.613 respectively show the initial and final graph associated with the **Example** slot. Since we use the **NARC** graph property, the loops of the final graph are stressed in bold.

Figure 5.613: Initial and final graph of the `open_atleast` constraint
