

5.383 sum

	DESCRIPTION	LINKS	GRAPH
Origin	[444].		
Constraint	<code>sum(INDEX, SETS, CONSTANTS, S)</code>		
Synonym	<code>sum_pred.</code>		
Arguments	<pre> INDEX : dvar SETS : collection(ind-int, set-sint) CONSTANTS : collection(cst-int) S : dvar </pre>		
Restrictions	<pre> SETS ≥ 1 required(SETS, [ind, set]) distinct(SETS, ind) CONSTANTS ≥ 1 required(CONSTANTS, cst) </pre>		
Purpose	S is equal to the sum of the constants of CONSTANTS corresponding to the INDEX th set of the SETS collection.		
Example	$\left(8, \left\langle \begin{array}{ll} \text{ind} - 8 & \text{set} - \{2, 3\}, \\ \text{ind} - 1 & \text{set} - \{3\}, \\ \text{ind} - 3 & \text{set} - \{1, 4, 5\}, \\ \text{ind} - 6 & \text{set} - \{2, 4\} \end{array} \right\rangle, \right. \\ \left. \langle 4, 9, 1, 3, 1 \rangle, 10 \right)$		
	The <code>sum</code> constraint holds since its last argument $S = 10$ is equal to the sum of the 2 th and 3 th items of the collection $\langle 4, 9, 1, 3, 1 \rangle$. As illustrated by Figure 5.744, this stems from the fact that its first argument $\text{INDEX} = 8$ corresponds to the value of the <code>ind</code> attribute of the first item of the SETS collection. Consequently the corresponding set $\{2, 3\}$ is used for summing the 2 th and 3 th items of the CONSTANTS collection.		
Typical	<pre> SETS > 1 CONSTANTS > SETS range(CONSTANTS.cst) > 1 </pre>		
Symmetry	Items of SETS are permutable .		
Arg. properties	Functional dependency : S determined by INDEX, SETS and CONSTANTS.		
Usage	In his article introducing the <code>sum</code> constraint, Tallys H. Yunes mentions the <i>Sequence Dependent Cumulative Cost Problem</i> as the subproblem that originally motivates this constraint.		

Figure 5.744: Illustration of the correspondence between the arguments of the `sum(INDEX, SETS, CONSTANTS, S)` constraint in the context of the **Example** slot (from right to left, $S = 10$ is equal to the sum of the constants 9 and 1 corresponding to the indices 2 and 3 of the set for which the `ind` attribute is equal to $INDEX = 8$)

Remark The `sum` constraint is called `sum_pred` in **MiniZinc** (<http://www.minizinc.org/>).

Algorithm The article [444] gives the [convex hull relaxation](#) of the `sum` constraint.

Systems [sum_pred](#) in **MiniZinc**.

See also **common keyword:** `element` (*data constraint*), `sum_ctr`, `sum_set` (*sum*).
used in graph description: `in_set`.

Keywords **characteristic of a constraint:** `convex hull relaxation`, `sum`.

constraint type: `data constraint`.

filtering: `linear programming`.

modelling: `functional dependency`.

Arc input(s)	SETS CONSTANTS
Arc generator	<i>PRODUCT</i> \mapsto <code>collection</code> (sets, constants)
Arc arity	2
Arc constraint(s)	<ul style="list-style-type: none"> • <code>INDEX = sets.ind</code> • <code>in_set</code>(constants.key, sets.set)
Graph property(ies)	<u>SUM</u> (CONSTANTS, cst) = S

Graph model

According to the value assigned to INDEX the arc constraint selects for the final graph:

- The $INDEX^{th}$ item of the SETS collection,
- The items of the CONSTANTS collection for which the key correspond to the indices of the $INDEX^{th}$ set of the SETS collection.

Finally, since we use the **SUM** graph property on the `cst` attribute of the **CONSTANTS** collection, the last argument `S` of the `sum` constraint is equal to the sum of the constants associated with the vertices of the final graph.

Parts (A) and (B) of Figure 5.745 respectively show the initial and final graph associated with the **Example** slot. Since we use the **SUM** graph property we show the vertices from which we compute `S` in a box.
