

## 5.178 in\_interval

	DESCRIPTION	LINKS	GRAPH	AUTOMATON
<b>Origin</b>	Domain definition.			
<b>Constraint</b>	<code>in_interval(VAR, LOW, UP)</code>			
<b>Synonyms</b>	<code>dom</code> , <code>in</code> .			
<b>Arguments</b>	VAR : <code>dvar</code> LOW : <code>int</code> UP : <code>int</code>			
<b>Restriction</b>	$LOW \leq UP$			
<b>Purpose</b>	Enforce the domain variable VAR to take a value within the interval [LOW, UP].			
<b>Example</b>	(3, 2, 5)			
	The <code>in_interval</code> constraint holds since its first argument <code>VAR = 3</code> is greater than or equal to its second argument <code>LOW = 2</code> and less than or equal to its third argument <code>UP = 5</code> .			
<b>Typical</b>	$LOW < UP$ $VAR > LOW$ $VAR < UP$			
<b>Symmetries</b>	<ul style="list-style-type: none"> <li>• LOW can be <a href="#">decreased</a>.</li> <li>• UP can be <a href="#">increased</a>.</li> <li>• An occurrence of a value of VAR can be <a href="#">replaced</a> by any other value in [LOW, UP].</li> <li>• One and the same constant can be <a href="#">added</a> to VAR, LOW and UP.</li> </ul>			
<b>Remark</b>	Entailment occurs immediately after posting this constraint. The <code>in_interval</code> constraint is referenced under the name <code>dom</code> in <a href="#">Gecode</a> .			
<b>Systems</b>	<code>member</code> in <a href="#">Choco</a> , <code>domin</code> in <a href="#">Gecode</a> , <code>in</code> in <a href="#">JaCoP</a> , <code>in</code> in <a href="#">SICStus</a> .			
<b>See also</b>	<b>common keyword:</b> <code>domain</code> , <code>in</code> ( <i>domain definition</i> ). <b>generalisation:</b> <code>in_interval_reified</code> ( <i>reified version</i> ), <code>in_intervals</code> ( <i>single interval replaced by a set of intervals</i> ), <code>in_set</code> ( <i>interval replaced by set variable</i> ).			
<b>Keywords</b>	<b>characteristic of a constraint:</b> <code>automaton</code> , <code>automaton without counters</code> , <code>reified automaton constraint</code> , <code>derived collection</code> . <b>constraint arguments:</b> unary constraint.			

**constraint network structure:** Berge-acyclic constraint network.

**constraint type:** value constraint.

**filtering:** arc-consistency.

**modelling:** interval, domain definition.

**Derived Collections**

```
col(VARIABLE-collection(var-dvar), [item(var - VAR)])
col( INTERVAL-collection(low-int, up-int),
    [item(low - LOW, up - UP)] )
```

**Arc input(s)**

VARIABLE INTERVAL

**Arc generator***PRODUCT*  $\mapsto$  collection(variable, interval)**Arc arity**

2

**Arc constraint(s)**

- variable.var  $\geq$  interval.low
- variable.var  $\leq$  interval.up

**Graph property(ies)***NARC* = 1**Graph model**

Parts (A) and (B) of Figure 5.401 respectively show the initial and final graph associated with the **Example** slot. Since we use the *NARC* graph property, the unique arc of the final graph is stressed in bold.

Figure 5.401: Initial and final graph of the *in\_interval* constraint

**Automaton**

Figure 5.402 depicts the automaton associated with the `in_interval` constraint. We have a single 0-1 signature variable  $S$  as well as the following signature constraint:  $\text{VAR} \geq \text{LOW} \wedge \text{VAR} \leq \text{UP} \Leftrightarrow S$ .
