

5.274 nequivalence

	DESCRIPTION	LINKS	GRAPH
Origin	Derived from <code>nvalue</code> .		
Constraint	<code>nequivalence(NEQUIV, M, VARIABLES)</code>		
Arguments	NEQUIV : <code>dvar</code> M : <code>int</code> VARIABLES : <code>collection(var-dvar)</code>		
Restrictions	<code>required(VARIABLES, var)</code> $NEQUIV \geq \min(1, VARIABLES)$ $NEQUIV \leq \min(M, VARIABLES)$ $NEQUIV \leq \text{range}(VARIABLES.var)$ $M > 0$		
Purpose	NEQUIV is the number of distinct rests obtained by dividing the variables of the collection VARIABLES by M.		
Example	$(2, 3, (3, 2, 5, 6, 15, 3, 3))$ Since the expressions $3 \bmod 3 = 0$, $2 \bmod 3 = 2$, $5 \bmod 3 = 2$, $6 \bmod 3 = 0$, $15 \bmod 3 = 0$, $3 \bmod 3 = 0$, and $3 \bmod 3 = 0$ involve two distinct values (values 0 and 2), the first argument NEQUIV of the <code>nequivalence</code> constraint is set to value 2.		
Typical	$NEQUIV > 1$ $NEQUIV < VARIABLES $ $NEQUIV < \text{range}(VARIABLES.var)$ $M > 1$ $M < \text{maxval}(VARIABLES.var)$		
Symmetries	<ul style="list-style-type: none"> Items of VARIABLES are <code>permutable</code>. An occurrence of a value u of VARIABLES.var can be <code>replaced</code> by any other value v such that v is congruent to u modulo M. 		
Arg. properties	<ul style="list-style-type: none"> <code>Functional dependency</code>: NEQUIV determined by M and VARIABLES. <code>Contractible</code> wrt. VARIABLES when $NEQUIV = 1$ and $VARIABLES > 0$. <code>Contractible</code> wrt. VARIABLES when $NEQUIV = VARIABLES$. <code>Extensible</code> wrt. VARIABLES when $NEQUIV = M$. 		
Algorithm	Since constraints $X = Y$ and $X \equiv Y \pmod{M}$ are similar, one should also use a similar algorithm as the one [27, 40] provided for constraint <code>nvalue</code> .		

See also

related: `nclass` (variable mod constant *replaced by* variable \in partition),
`ninterval` (variable mod constant *replaced by* variable/constant),
`npair` (variable mod constant *replaced by* pair of variables).
specialisation: `nvalue` (variable mod constant *replaced by* variable).

Keywords

constraint arguments: pure functional dependency.
constraint type: counting constraint, value partitioning constraint.
final graph structure: strongly connected component, equivalence.
modelling: number of distinct equivalence classes, functional dependency.

Arc input(s)	VARIABLES
Arc generator	<i>CLIQUE</i> \mapsto collection(variables1, variables2)
Arc arity	2
Arc constraint(s)	variables1.var mod M = variables2.var mod M
Graph property(ies)	<u>NSCC</u> = NEQUIV

Graph model

Parts (A) and (B) of Figure 5.574 respectively show the initial and final graph associated with the **Example** slot. Since we use the **NSCC** graph property we show the different strongly connected components of the final graph. Each strongly connected component corresponds to one equivalence class: We have two equivalence classes that respectively correspond to values $\{3, 6, 15\}$ and $\{2, 5\}$.
