

**5.309 ordered\_nvector**

	DESCRIPTION	LINKS	GRAPH
<b>Origin</b>	Derived from <code>nvector</code> .		
<b>Constraint</b>	<code>ordered_nvector(NVEC, VECTORS)</code>		
<b>Synonyms</b>	<code>ordered_vectors</code> , <code>ordered_npoint</code> , <code>ordered_npoints</code> .		
<b>Type</b>	VECTOR : <code>collection(var-dvar)</code>		
<b>Arguments</b>	NVEC : <code>dvar</code> VECTORS : <code>collection(vec - VECTOR)</code>		
<b>Restrictions</b>	$ \text{VECTOR}  \geq 1$ $\text{NVEC} \geq \min(1,  \text{VECTORS} )$ $\text{NVEC} \leq  \text{VECTORS} $ <code>required(VECTORS, vec)</code> <code>same_size(VECTORS, vec)</code>		

Enforces the following two conditions:

**Purpose**

1. NVEC is the number of distinct tuples of values assigned to the vectors of the collection VECTORS. Two tuples of values  $\langle A_1, A_2, \dots, A_m \rangle$  and  $\langle B_1, B_2, \dots, B_m \rangle$  are *distinct* if and only if there exist an integer  $i \in [1, m]$  such that  $A_i \neq B_i$ .
2. For each pair of consecutive vectors  $\text{VECTOR}_i$  and  $\text{VECTOR}_{i+1}$  of the VECTORS collection we have that  $\text{VECTOR}_i$  is lexicographically less than or equal to  $\text{VECTOR}_{i+1}$ . Given two vectors,  $\vec{X}$  and  $\vec{Y}$  of  $n$  components,  $\langle X_0, \dots, X_{n-1} \rangle$  and  $\langle Y_0, \dots, Y_{n-1} \rangle$ ,  $\vec{X}$  is *lexicographically less than or equal to*  $\vec{Y}$  if and only if  $n = 0$  or  $X_0 < Y_0$  or  $X_0 = Y_0$  and  $\langle X_1, \dots, X_{n-1} \rangle$  is lexicographically less than or equal to  $\langle Y_1, \dots, Y_{n-1} \rangle$ .

**Example**

$$\left( 2, \left\langle \begin{array}{l} \text{vec} - \langle 5, 6 \rangle, \\ \text{vec} - \langle 5, 6 \rangle, \\ \text{vec} - \langle 5, 6 \rangle, \\ \text{vec} - \langle 9, 3 \rangle, \\ \text{vec} - \langle 9, 3 \rangle \end{array} \right\rangle \right)$$

The `ordered_nvector` constraint holds since:

1. Its first argument  $\text{NVEC} = 2$  is set to the number of distinct tuples of values (i.e., tuples  $\langle 5, 6 \rangle$  and  $\langle 9, 3 \rangle$ ) occurring within the collection VECTORS.
2. The vectors of the collection VECTORS are sorted in increasing lexicographical order.

**Typical**

```

|VECTOR| > 1
NVEC > 1
NVEC < |VECTORS|
|VECTORS| > 1

```

**Arg. properties**

- **Functional dependency**: NVEC determined by VECTORS.
- **Contractible** wrt. VECTORS when NVEC = 1 and |VECTORS| > 0.
- **Contractible** wrt. VECTORS when NVEC = |VECTORS|.

**Reformulation**

The `ordered_nvector` constraint can be reformulated as a conjunction of a `nvector` and a `lex_chain_lesseq` constraints.

**See also**

**implies**: `lex_chain_lesseq` (NVEC of constraint `ordered_nvector` removed), `nvector`, `ordered_atleast_nvector` (= NVEC replaced by  $\geq$  NVEC), `ordered_atmost_nvector` (= NVEC replaced by  $\leq$  NVEC).

**related**: `increasing_nvalue_chain`.

**root concept**: `increasing_nvalue`.

**used in graph description**: `lex_less`, `lex_lesseq`.

**Keywords**

**characteristic of a constraint**: `vector`.

**constraint type**: counting constraint, order constraint.

**modelling**: functional dependency.

**symmetry**: symmetry.

<b>Arc input(s)</b>	VECTORS
<b>Arc generator</b>	$\text{PATH} \mapsto \text{collection}(\text{vectors1}, \text{vectors2})$
<b>Arc arity</b>	2
<b>Arc constraint(s)</b>	$\text{lex\_lesseq}(\text{vectors1.vec}, \text{vectors2.vec})$
<b>Graph property(ies)</b>	$\text{NARC} =  \text{VECTORS}  - 1$
<b>Arc input(s)</b>	VECTORS
<b>Arc generator</b>	$\text{PATH} \mapsto \text{collection}(\text{vectors1}, \text{vectors2})$
<b>Arc arity</b>	2
<b>Arc constraint(s)</b>	$\text{lex\_less}(\text{vectors1.vec}, \text{vectors2.vec})$
<b>Graph property(ies)</b>	$\text{NCC} = \text{NVEC}$

**Graph model**

Parts (A) and (B) of Figure 5.630 respectively show the initial and final graph of the second graph constraint associated with the **Example** slot. Since we use the **NCC** graph property in this second graph constraint, we show the different connected components of the final graph. Each strongly connected component corresponds to a tuple of values that is assigned to some vectors of the **VECTORS** collection. The 2 following tuple of values  $\langle 5, 6 \rangle$  and  $\langle 9, 3 \rangle$  are used by the vectors of the **VECTORS** collection.

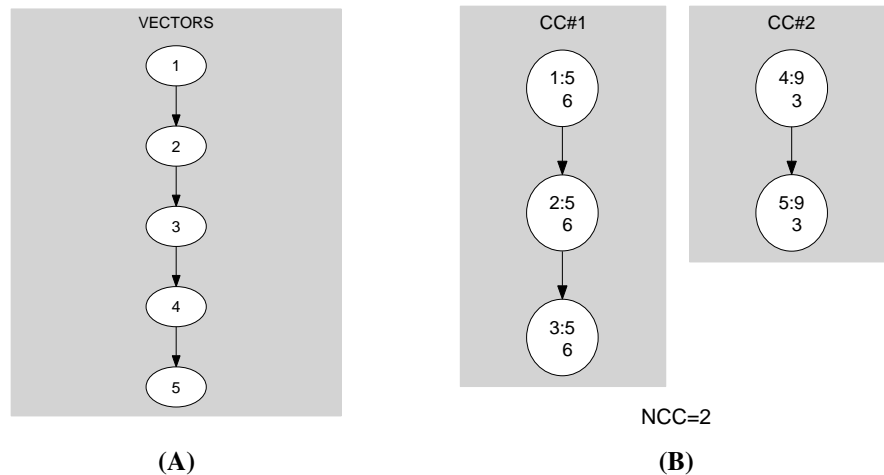

Figure 5.630: Initial and final graph of the ordered\_nvector constraint
